Note To Users

Since 1961, estimates of waterfowl harvest and hunting activity and success in the United States have been derived from the U.S. Fish and Wildlife Service's Waterfowl Harvest Survey. This is a 2-part survey including: 1) a questionnaire survey used to determine hunting activity and success and total harvest; and 2) a waterfowl-parts-collection survey used to apportion harvest by species, age, and sex.

From 1961 to 2001, the questionnaire portion of the survey (termed the "Mail Questionnaire Survey" or MQS) was a mail survey of individuals who purchased duck stamps with the intention of hunting waterfowl. Problems with the sampling frame led to a new survey design in the mid-1990s. This design, called the Harvest Information Program (HIP), was fully implemented in 1999. The new questionnaire portion of the survey includes some species and groups of migratory game birds other than waterfowl (e.g. woodcock and doves). The parts-collection portion of the survey was expanded to include these species and groups as well.

Because the source of participants and the design of the questionnaire survey in the Harvest Information Program are different from those in the previously used survey, the estimates of waterfowl harvest, hunting activity, and hunter success derived from the 2 surveys **are not comparable**. For this reason, the harvest estimates (1961-2001) based on the discontinued MQS were placed in a separate compilation entitled "Estimates of Waterfowl Harvest, Hunting Activity, and Success, 1961-2001." Copies of the final MQS report are available upon request from the U.S. Fish and Wildlife Service's Atlantic Flyway Representatives office.

Flyway Data Books contain annual estimates of migratory bird abundance, harvest, and hunter participation and activity. Due to the large volume of data and the number of years, species, and geographic areas involved, data tables may be large and complex. Readers that may need help reading and interpreting the data, or that may need data presented in an alternative format to facilitate reading and interpretation, should contact the U.S. Fish and Wildlife Service's Atlantic Flyway Representatives office with specific request.

¹ From aerial photo counts² From visual ground counts³ Broods accompanied by 2 parents⁴ No spring survey conducted - the value provided was derived from population model published in Gauvin & Reed (CWS Occas. Pap. No. 64. 1987)⁵ The estimates in brackets have been corrected to account for flocks not observed during the survey, using data from a telemetry study.
